

v0.7

Changes

- Updated the WAYF. It now has a new, cleaner layout and loading and searching should be much faster.
- Disable the consent page for CManage (we're looking into the best place to ask for consent and offer an AUP)
- Correctly send the `sn` (surname) attribute to SAML and OIDC clients
- Pass the correct attributes to SAML clients. The "friendly name" attributes (e.g. `givenName`) are no longer available. Instead use the "oid" format (e.g., `urn:oid:2.5.4.42`) or the "urn:mace" format (e.g., `urn:mace:dir:attribute-def:givenName`).
- Initial support for SAML and OIDC SPs that are connected to multiple COs
- Send a fixed set of attributes to each SAML SP, disregarding restrictions defined in the SP metadata
- Add CManage plugins to support enrolling guests from an external system (for UU/Yoda pilot)
- Initial support for updating COperson attributes from changed SAML attributes when a user logs in
- Support for provisioning COperson Role affiliations to ldap
- Fix provisioning of renamed groups
- Fix deprovisioning of COUs
- Fix provisioning of email addresses
- Rewrite and improve the "pam-websso" authentication method (see [PAM Module](#))
- Switch to more consistent ldap schemas
- Improvements to the LSC configurations
- Improve SAML metadata
- Improve automatic deploy tests
