

# Provisioning users to Google Workspace

Before people on your team can sign in and use your organization's Google services, they need a user account. There are several methods to provision users to Google Workspace:

1. The easiest way to add user accounts is to add them individually in the Google Admin Console. Read [this Google Workspace support page](#) for more on this.
2. If you have many users, you can add their accounts all at once from a spreadsheet or CSV-file. Read [this page](#) for an overview.
3. On that page you will also find a way to use LDAP synchronisation.
4. If you are keen on using API's, try [Google Workspace Provisioning API which you can find here](#).
